Question 0: read data and process missingness

```
dat <- read_csv("classroom.csv")
```

```
## Rows: 1190 Columns: 12
## -- Column specification ------------------------------------------------
## Delimiter: ","
## dbl (12): sex, minority, mathkind, mathgain, ses, yearstea, mathknow, housep...
##
## i Use `spec()` to retrieve the full column specification for this data.
## i Specify the column types or set `show_col_types = FALSE` to quiet this message.
# construct new outcome math1st
dat <- dat %>%
    mutate(math1st = mathkind + mathgain)

# remove missing data
dat <- dat %>%
    filter(complete.cases(dat))
```
Question 1

```
# fit a model
fit1 <- lmerTest::lmer(math1st ~ housepov + yearstea + mathprep + mathknow + ses +
    sex + minority + (1 | schoolid/classid), data = dat)
summary(fit1)
```

```
## Linear mixed model fit by REML. t-tests use Satterthwaite's method [
## lmerModLmerTest]
## Formula: math1st ~ housepov + yearstea + mathprep + mathknow + ses + sex +

```

```r
# plot residuals to test normality assumption
res1 <- residuals(fit1)
qqnorm(res1, pch = 1, frame = FALSE)
qqline(res1, col = "steelblue", lwd = 2)
```
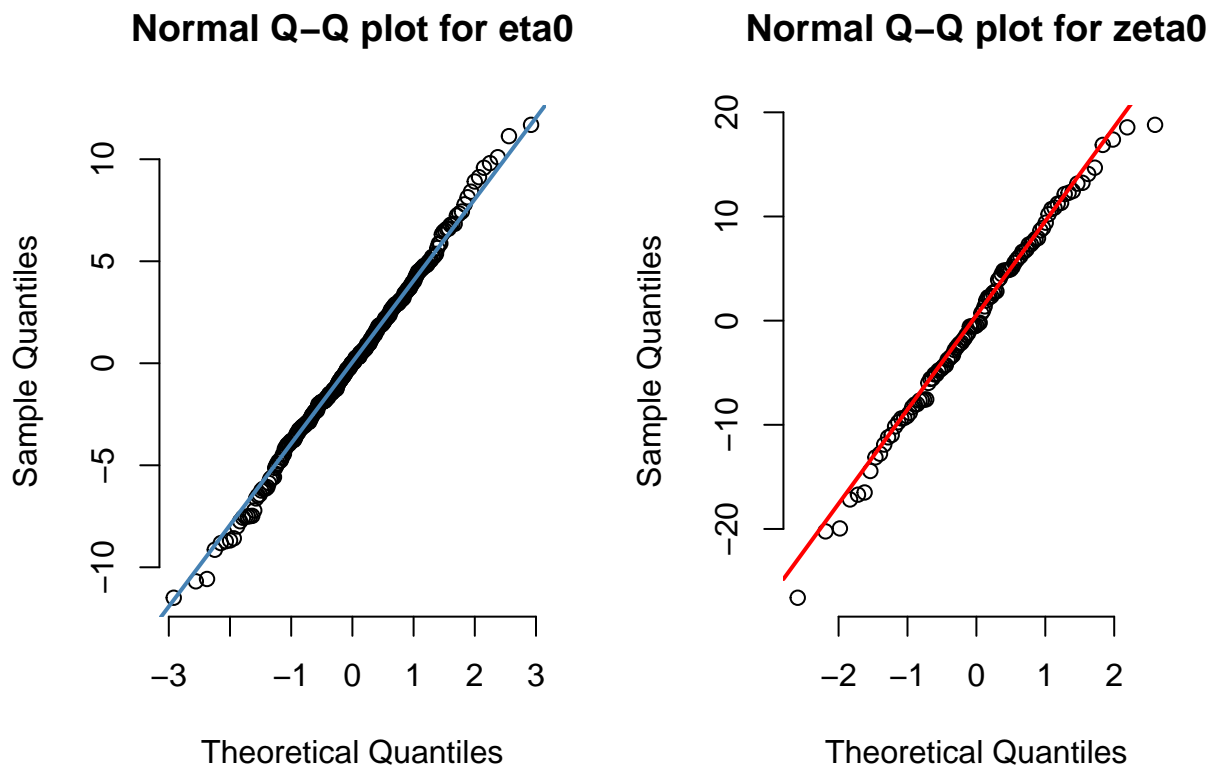

Normal Q–Q Plot

QQ plot shows that points are around the line, and thus we believe the normality assumption holds.

Question 2

```r
# Generate the two sets of BLUPs (for random effects zeta0 and eta0)
blups_fit1 <- ranef(fit1)

par(mfrow = c(1, 2))
# examine normality for eta0 (class-level)
eta0_fit1 <- blups_fit1$`classid:schoolid`$`(Intercept)`
qqnorm(eta0_fit1, pch = 1, frame = FALSE, main = "Normal Q-Q plot for eta0")
qqline(eta0_fit1, col = "steelblue", lwd = 2)

# examine normality for zeta0 (school-level)
zeta0_fit1 <- blups_fit1$schoolid$`(Intercept)`
qqnorm(zeta0_fit1, pch = 1, frame = FALSE, main = "Normal Q-Q plot for zeta0")
qqline(zeta0_fit1, col = "red", lwd = 2)
```

```r
par(mfrow = c(1, 1))
```

QQ plot shows that both sets of BLUPs of zeta0 and eta0 are around the line, and thus we believe the normality assumption holds.

Question 3

```r
# a add a random slope for minority, correlated with the random intercept, at
# the school level
fit2 <- lmerTest::lmer(math1st ~ housepov + yearstea + mathprep + mathknow + ses +
    sex + minority + (minority | schoolid) + (1 | classid), data = dat)
```

```
print(summary(fit2))
```

```
## Linear mixed model fit by REML. t-tests use Satterthwaite's method [
## lmerModLmerTest]
## Formula: math1st ~ housepov + yearstea + mathprep + mathknow + ses + sex +
##     minority + (minority | schoolid) + (1 | classid)
##    Data: dat

## minority -0.494 -0.157  0.027 -0.002  0.099  0.113 -0.014
```

```r
# b residual
blups_fit2 <- ranef(fit2)
# BULPs
zeta0 <- blups_fit2$schoolid$`(Intercept)`
zeta1 <- blups_fit2$schoolid$minority
eta0 <- blups_fit2$classid$`(Intercept)`

# c check normality
par(mfrow = c(2, 2))
```

```r
# examine normality for eta0 (class-level)
qqnorm(eta0, pch = 1, frame = FALSE, main = "Normal Q-Q plot for eta0")
qqline(eta0, col = "steelblue", lwd = 2)

# examine normality for zeta0 (school-level)
zeta0_fit1 <- blups_fit1$schoolid$`(Intercept)`
qqnorm(zeta0, pch = 1, frame = FALSE, main = "Normal Q-Q plot for zeta0")
qqline(zeta0, col = "red", lwd = 2)

# examine normality for zeta1 (random slop)
qqnorm(zeta1, pch = 1, frame = FALSE, main = "Normal Q-Q plot for zeta1")
qqline(zeta1, col = "chartreuse3", lwd = 2)
par(mfrow = c(1, 1))
```

QQ plot shows that BLUPs of zeta0, eta0, and zeta1 are around the line, and thus we believe the normality assumption holds.

```r
# d
plot(zeta1, zeta0)
```

Over-
all, zeta0 and zeta1 are negative correlated. However, some odd points are positive correlated.

```r
# e these schools are
unique(dat$schoolid)[3 - abs(blups_fit2$schoolid$minority) > 0]
```

```
##  [1]    1    4    5    9   10   12   14   16   17   20   22   24   26   28   33   38   40   42   43
## [20]   45   46   47   52   53   57   61   66   69   73   78   79   80   84   86   89   90   95   96
## [39]   98  100  101  102  103  104  106
```

```r
odd_point <- dat %>%
    filter(schoolid %in% unique(dat$schoolid)[3 - abs(blups_fit2$schoolid$minority) >
        0])
```

Students in these schools are almost minority.

Question 4

a

$V_S = 93.89$, $V_C = 169.45$, and $V_E = 1064.96$.

```r
# fit a model
fit3 <- lmerTest::lmer(math1st ~ housepov + yearstea + mathprep + mathknow + ses +
    sex + minority + (ses | schoolid) + (1 | classid), data = dat)
summary(fit3)
```

```
## Linear mixed model fit by REML. t-tests use Satterthwaite's method [
## lmerModLmerTest]
## Formula: math1st ~ housepov + yearstea + mathprep + mathknow + ses + sex +
##     minority + (ses | schoolid) + (1 | classid)
##    Data: dat
##

## minority -0.325 -0.182  0.021  0.002  0.108  0.117 -0.011
```

c

$V_C = 86.57$, $V_{S(ses=0)} = 171.18$, and $V_E = 73.36$.

d

$V_{S(ses=-0.50)} = 171.18 + 2*(-0.5)*13.083*8.565*0.19 + (-0.5)^2*73.36 = 168.23$

$V_{S(ses=0.50)} = 171.18 + 2*(0.5)*13.083*8.565*0.19 + (0.5)^2*73.36 = 210.81$

e

There is heteroscedasticity at school level because $V_{S(ses=0.50)}$ and $V_{S(ses=-0.50)}$ are not approximate.
